

POWDAR

Stray and Owned Dog Registry
and Incident Reporting System

PRESENTED BY

- Lat, Nib Hoxan

Background and Purpose

Addressing the lack of central tracking for dog ownership, health records, and incident history, Pawdar integrates community reporting, registry, and case management for **fast access** to crucial information.

- Barangays, vets, and LGUs have no central place to track dog ownership, health records, or incident history
- Nobody knows which dogs are registered, which are strays, or who owns what
- Pawdar combines a community incident feed, a public dog registry, and a civic case management layer
- Dog owners register pets, community members report incidents, officials track cases, vets verify vaccinations, rescue groups manage strays
- Goal: when something happens involving a dog, anyone who needs information can find it fast

Website Blueprint Overview

INCIDENT FEED

Pawdar features a **real-time stream** of reported dog-related incidents, allowing users to easily access relevant information and track events within their community.

DOG REGISTRY

The platform includes a **central dog database** covering both owned and stray dogs, utilizing QR code tags for easy identification and verification of vaccination records.

INCIDENT MAP

Pawdar's **live Incident Map** provides a color-coded visualization of reported events, helping local government units plan and respond effectively to community needs.

Functional Requirements

USER AUTHENTICATION

Pawdar ensures secure access through role-based user authentication, allowing owners, reporters, vets, and LGU officials to log in and manage their respective functionalities seamlessly.

INCIDENT REPORTING

Community members can report incidents using a simple interface, with CRUD functionalities that allow them to file, track, and update reports effectively as cases progress.

DOG REGISTRY CRUD

The platform supports full CRUD operations for dog profiles, enabling owners to create and manage their pets' information, while vets can verify vaccination records easily.

QR CODE SYSTEM

Each registered dog is assigned a unique QR code, linking to its profile. This enhances quick access to important information, such as vaccination records and ownership details.

Non-Functional Requirements

SECURITY MEASURES

Pawdar ensures **data protection** through role-based access and encrypted user information.

PERFORMANCE STANDARDS

The platform achieves **rapid load times** of under 3 seconds, even during peak usage.

USABILITY FOCUS

Users can submit reports in **under 2 minutes**, ensuring a smooth reporting process.

SYSTEM RELIABILITY

Regular data backups maintain **platform availability**, even during periods of high activity.

TRANSPARENCY ASSURANCE

All case histories and vaccination records are **logged** for accountability and public trust.

CRUD Functionalities

CREATE OPERATIONS

Pawdar allows users to **register dogs** and submit incident reports seamlessly. This function ensures that all necessary data is captured for efficient tracking and management.

READ FEATURES

Users can easily **browse the incident feed** and maps, viewing detailed profiles and case histories. This accessibility promotes transparency and informed community participation.

UPDATE AND DELETE

Pawdar enables users to **edit profiles** and update case statuses. Additionally, it provides options to remove dog profiles or deactivate accounts, maintaining data integrity and user control.

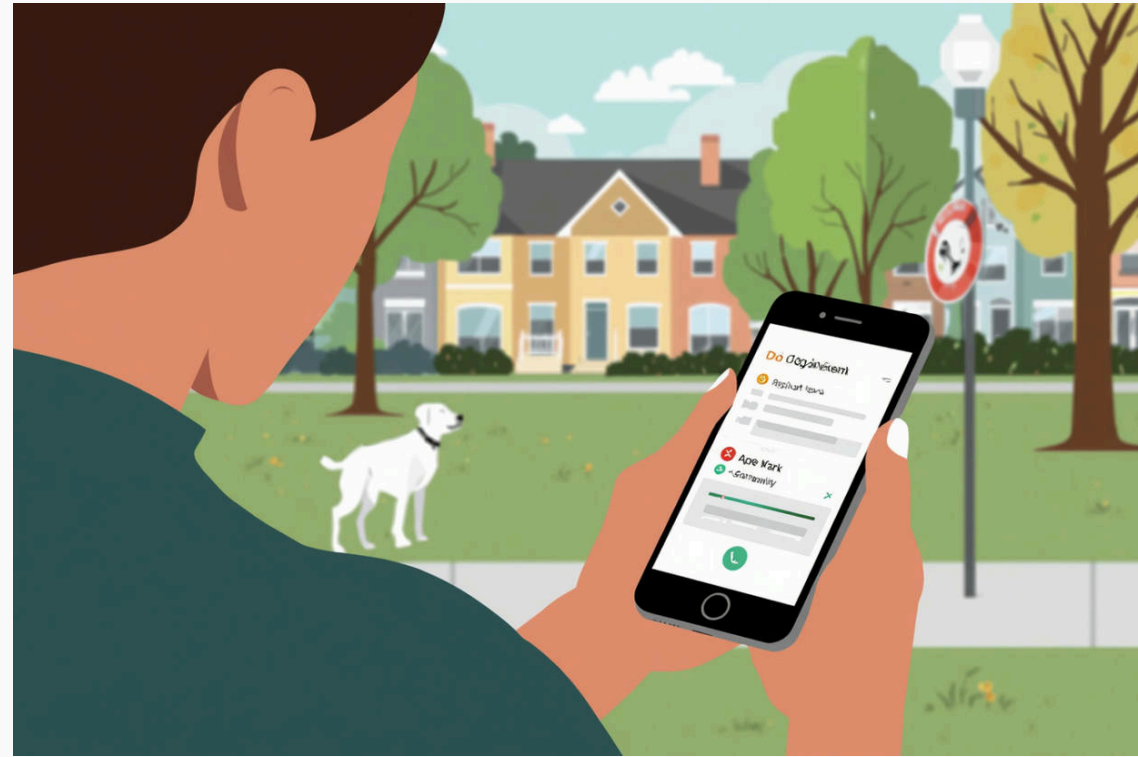

Beneficiaries

HAPPY DOG OWNER

Dog Ownership

A joyful dog owner enjoying quality time with their beloved pet in a park.

MOBILE REPORTING

Community Engagement

A community member actively using a mobile app to report a dog-related incident.

VETERINARY CARE

Health Verification

A veterinarian providing care and verifying vaccination records for a happy dog in the clinic.
